

High Value Payments

Complete visibility across your large value and high priority transactions

When dealing with High Value payments, businesses need to ensure they have oversight over large value and high priority payments. Monitoring even a single payment can be complex, requiring multiple checks, balances and approvals. Without detail into these transactions, issues such as settlement or processing delays can cause major impacts to banks and corporations, including losing customer trust, regulatory action and penalties, and negative credit rating.

IR Transact's High Value Payments provides a single dashboard to monitor the health of your high value in-flight transactions across payment queues and delivers an end-to-end view of transactions impacting associated bank accounts. Leverage your own business data to get a view of key accounts, such as your Settlement or High Value customer accounts, and easily monitor balance thresholds, flagged accounts, project liquidity shortfalls or abnormal account usage patterns.

With IR Transact's High Value Payments you can ensure that anomalies, such as bottlenecks and processing backlogs are identified as they develop, ensuring you get ahead of potentially disruptive events before they occur and saving you time monitoring and analyzing time-critical data and systems.

IR High-Value Product Offering

Real-time Monitoring and Troubleshooting

Intelligent Alerting & Dynamic Baselining

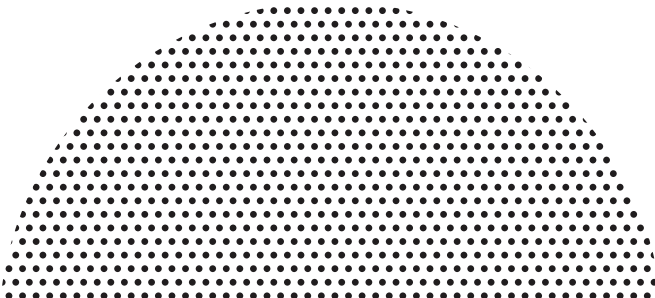

On-Demand Reporting & Business Insights

Customizable Dashboards & Visualizations

- **Transaction Health and Queue Monitoring** – a single dashboard to monitor the health of your High Value in-flight transactions across different payment queues.
- **Transaction Detail Drilldown and History** – with one click, drill down into the details in your High Value transactions hub to access detailed historical transaction information, allowing users to easily investigate and identify the root cause of issues.
- **Transaction Volumes and Anomalies** – comprehensive dashboards to easily track transaction volumes, and alerts and dynamic thresholds to notify users of anomalies as they develop.
- **Bank Account and Liquidity Monitoring** – an end-to-end view on transactions and associated impact on bank accounts, including flagged accounts, liquidity shortfalls or abnormal account usage.
- **Payment Hub System Monitoring** – view metrics about servers, databases and application components within your Payment Hub, ensuring issues are identified and addressed before they escalate.
